Funding

The National Cardiovascular Disease Database (NCVD)-Acute Coronary Syndrome (ACS) Registry is funded with grants from the Ministry of Health Malaysia (MOH) and the National Heart Association of Malaysia (NHAM)

ISSN Number: ISSN 1985-4757

ACKNOWLEDGEMENTS

The National Cardiovascular Disease Database (NCVD)-Acute Coronary Syndrome (ACS) Registry would like to extend its appreciation to everyone who helped make this report possible.

We would especially like to thank the following:

- National Heart Association of Malaysia (NHAM)
- Health Informatics Centre, Ministry of Health Malaysia
- Clinical Research Centre (CRC), Ministry of Health Malaysia
- The members of various expert panels
- Our source data providers

PREFACE

This is the 5th report of the National Cardiovascular Disease-Acute Coronary Syndrome Registry (NCVD-ACS). The previous reports of 2006, 2007 – 2008, 2009 – 2010, and 2011 – 2013 have given us valuable insight into the nature and impact of acute coronary syndrome (ACS) in Malaysia. Importantly, this report marks the 10th year since the inception of the NCVD-ACS Registry, a registry which is now one of the most important resource on ACS in the country, and indeed for the region. The NCVD-ACS and NCVD-Percutaneous Coronary Intervention (PCI) studies and reports are some of the major undertakings of the National Heart Association of Malaysia in providing the country with accurate and relevant data on these subjects that hopefully will aid the formulation of appropriate treatment strategies to manage coronary heart disease.

This report was made possible primarily due to the many source data providers (SDPs) who have voluntarily contributed valuable information into our secured electronic database. The evolution in diagnostics and therapeutic strategies in the management of ACS has resulted in improved clinical outcomes, and this is reflected in consecutive NCVD-ACS Registry reports. From the use of more sensitive cardiac biomarkers to early invasive strategy, these advances have driven favourable outcomes for patients with ACS. The information obtained from SDPs across the country have not only provided a snapshot of ACS in Malaysia, but more significantly, uninterrupted annual data on the disease since 2006.

We would like to acknowledge the contribution of our peers and colleagues in both the Governance Board of the NCVD and the Steering Committee of the NCVD-ACS Registry. We also commend the efforts of the NCVD Medical Writing Committee for this report, led by Prof Dr Wan Azman Wan Ahmad, who has put in over a decade of work into all the reports of the NCVD-ACS Registry published to date. His leadership and tireless efforts can be reflected in this excellent report which you have today.

We would like to thank the Ministry of Health Malaysia for the initial financial grant for the NCVD Registries and the National Heart Association of Malaysia together with the Health Informatics Centre, MOH Malaysia for the yearly financial support which helped sustain the NCVD-ACS Registry for the last 10 years.

Finally, it is our genuine hope that this report will encourage even greater participation of centres in Malaysia into the NCVD-ACS Registry. This registry should spur more outcome-based research and provide direction so that more basic research can be undertaken. Not only should this registry generate better data to further improve healthcare delivery and patient outcomes locally, but also contribute towards the global scientific pool of knowledge in ACS.

Thank you.

Datuk Dr Rosli Mohd Ali

Chairman

NCVD Governance Board

FOREWORD

After a decade since the inception of the National Cardiovascular Disease, Acute Coronary Syndrome (NCVD-ACS) Registry, it is my great honour and pleasure to present you this 5th Report – a compilation of data involving patients admitted with ACS in Malaysia, between the years of 2014–2015.

Data from 17,771 patients from 23 source data providers (SDPs) was collected and analysed. The volume of data compiled reflects the dedication of all those involved at the SDPs, staff of the National Heart Association of Malaysia (NHAM) and those involved from the Ministry of Health (MOH), who have been consistent in their efforts to ensure the data collected remained of the highest quality. There has been a year-on-year increase in the number of patient notification reports into the NCVD-ACS Registry; In 2015, for the first time, we crossed the 10,000 patients mark!

On behalf of the Steering Committee of the NCVD-ACS Registry, I would like to thank all those who contributed to the writing of this report and the Governance Board of the NCVD for their support. This report also examines the similarities and differences among the patients with ACS admitted between 2014–2015 and those described in the previous report.

Over the last decade, deaths from circulatory diseases including ACS, remains the principal cause of mortality in the country. Data from previous NCVD-ACS Registry reports have been published and have directly contributed to our National Clinical Practice Guidelines (CPGs). Through the NCVD-ACS Registry reports, we have seen the impact of CPGs and the subsequent reduction in in-hospital and 30-day all-cause mortality rates.

Finally, I would like to acknowledge Prof Datuk Paduka Dr Wan Azman and Prof Datuk Dr Sim Kui Hian for their vision and leadership over the last decade and for their direct involvement in this NCVD Registry. Through their efforts, the NCVD-ACS Registry is now one of the largest, prospective, single disease registries of Malaysia. This Registry will provide greater insight into ACS pathophysiology, management and impact on patients in our nation. It will also serve as the main resource for future research and policy planning to improve health outcomes of such patients.

Thank you.

Dr Alan Fong Yean Yip
Chairman, Steering Committee
NCVD-ACS Registry

NOTE FROM THE WRITING COMMITTEE CHAIRMAN

The NCVD-ACS registry was established in 2006, and we have already published four reports. In the last report (NCVD-ACS registry 2011 – 2013), 14,763 patients from 19 source data providers (SDPs) were analysed. For the present report, 17,771 patients admitted with acute coronary syndrome (ACS) between 2014 and 2015 were obtained from 23 SDPs. Over the last 10 years, the NCVD-ACS had reported on 49,406 ACS patients, making it the biggest database on ACS in Malaysia. Overview of the five chapters in this report:

Cardiac services: In 2015, the number and density of registered cardiologists in the National Specialist Register in Malaysia increased from 219 (7.3 per million populations [pmp]) to 236 (7.5 pmp); however, the density of cardiologists pmp is still low compared to more developed countries. There is still an uneven distribution of cardiologists and cardiac catheterisation labs across the country despite numerous improvement measures by the relevant authorities.

Patient characteristics: The baseline characteristics of patients in this report were generally similar to that of the previous report, with a few notable points to highlight: Patients who presented with ACS remained young, with a significant proportion under the age of 50 years. Of the three major ethnic groups, over a quarter of Malay and Indian patients presenting with ACS was below the age of 50 years. There was a high prevalence of hypertension, dyslipidaemia and diabetes in this report, comparable with previous reports of the NCVD-ACS Registry.

Clinical presentations and investigations: The spectrum of ACS in 2014 – 2015 revealed that the commonest subtype was STEMI (46.1%), similar to previous years. Two-thirds of STEMI had intermediate-high TIMI risk score; whereas, NSTEMI-UA had slightly higher intermediate-high score in 2014 – 2015 compared to 2011 – 2013. The proportion of STEMI remained highest in the young patients. The proportion of NSTEMI-UA amongst elderly ACS patients increased to 62.9%. The proportion of Killip III – IV doubled amongst the elderly population compared to the young. The ratio of male: female remained at 4:1 for ACS. Among men, 50.5% presented with STEMI, whereas among women, 70.8% presented with NSTEMI/UA.

Treatment: Similar length of admission was observed in CCU/ICU for all spectrums of ACS and age groups. The use of DAPT was up to 96% for STEMI and more than 90% for NSTEMI. Statin use exceeded 90% for all spectrums of ACS. Beta-blocker use upon discharge was 69% for STEMI, 67.2% for NSTEMI and 66.9% for UA. ACE inhibitor/ARB use upon discharge was 56.1%, 50.5%, and 54.5% for STEMI, NSTEMI and UA respectively. Majority (81%) of STEMI patients who presented to non-PCI capable centre received fibrinolysis. 16.4% of STEMI patients presenting to a PCI-capable centre underwent primary PCI, which was a significant increase from the previous report. The median door-to-needle (DTN) time was 45 minutes and 35.2% achieved DTN time of less than 30 minutes. The median door-to-device (balloon) (DTB) time was 69 minutes and 63.6% achieved DTB time of less than 90 minutes.

Outcome: The overall in-hospital and 30-day mortality rates remained constant at 7.4% and 9.2% respectively compared to NCVD-ACS 2011 – 2013 (7.6% and 9%). STEMI remained as the highest in-hospital (10.6%) and 30-day (12.3%) risk for mortality post-event. Patients who received fibrinolytic therapy or PCI had better outcome than those who did not. Hospitals with cardiac catheterisation facility registered lower in-hospital and 30-day mortalities. Advanced age, higher Killip classification and TIMI risk score at presentation as well as diabetes were independent risk factors for poor prognosis.

This report provides information of our current medical practices. It provides tremendous opportunities for further improvement and direction for future planning. More STEMI patients are expected to receive primary PCI via STEMI network initiative. It is important to develop a clinical pathway to shorten DTB time and DTN time. Adhering to treatment guidelines, instituting secondary prevention programme and strengthening cardiac rehabilitation services are important measures to prevent the recurrence of ACS-related hospital readmission and to improve long-term outcome.

Last but not least, I would like to thank all those involved for the endless effort and admirable determination in contributing data and for the publication of this report. These efforts and contributions would definitely greatly impact the future management of cardiovascular disease in this nation.

Prof Datuk Paduka Dr Wan Azman Wan Ahmad

CHAPTER 1: PROVISION OF CORONARY CARE SERVICES IN MALAYSIAOmar Ismail¹, Siti Khairani Zainal Abidin², Wan Azman Wan Ahmad³¹ Hospital Pulau Pinang, ² Hospital Tengku Ampuan Afzan, ³ Pusat Perubatan Universiti Malaya**Summary**

1. The number and density of registered cardiologists in the National Specialist Registry, Malaysia had increased from 219 (7.3 pmp) to 236 (7.5 pmp).
2. The density of cardiologist per million populations was still low compared to more developed countries.
3. There was still an uneven distribution of cardiologists and cardiac catheterisation labs across the country despite numerous improvement measures taken by the authority.

Introduction

According to the report from the Department of Statistics Malaysia in 2014, ischaemic heart disease remained as the principal cause of death among Malaysians at 13.5%¹. Men and women across the three main ethnic groups; namely Malay, Chinese and Indian between the age 15 – 64 years old were equally affected.

Over the last decades, we have seen tremendous progress in coronary care services in Malaysia to fulfill the requirement of our population. Significant numbers of new government and private hospitals are now offering cardiac services, although there is still no homogenous distribution. Based on the last report of the Malaysian National Cardiovascular Disease Database-Acute Coronary Syndrome (NCVD-ACS) registry 2011 – 2013, the all-cause in-hospital and 30-day mortality rates were 7.6% and 9% respectively². Following STEMI, 75% of patients were treated with fibrinolytic therapy and only 9.4% received primary angioplasty. To improve outcome and timely care, prompt effective treatment for patients with ACS is considered a high priority key performance indicator for government hospitals.

Number and density of cardiologists in Malaysia

In 2015, the total number of registered cardiologists in Malaysia was 236 (Table 1.1), an increase from the previous report. Most cardiologists (83%) were employed by the private sector while only 17% were attached to the public sector (Ministry of Health [MOH] and Ministry of Higher Education [MOHE]). Nearly half of the total number of cardiologists in the country were working in the Klang Valley (Selangor, Wilayah Persekutuan (WP) Kuala Lumpur and Putrajaya).

The cardiologist density ratio in Malaysia was 0.075 per 10,000 population or 7.5 per million population (pmp). WP Kuala Lumpur had the highest density ratio of 41.5 pmp, followed by Selangor and WP Putrajaya with 6.7 pmp and Sarawak with 6.2 pmp. Similar to the previous report, there was no registered cardiologists in Perlis. Terengganu had the lowest density of cardiologist per population (0.8 pmp) followed by Sabah and WP Labuan (2 pmp).

In China, the ratio of cardiologist to population was 19 pmp in 2011³. And Europe has long surpassed Asian countries with the reported mean ratio of 58 cardiologists pmp across EU countries in the year 2000⁴. A study done by MedAxiom in 2013 on the cardiology workforce across United States revealed between 180.8 and 421.5 cardiologists for 100,000 populations⁵. This figure far exceeds our numbers where the target rate was 100 per million. Having said that, the Global Health Observatory data of World Health Organization reported that Malaysia had among the highest ratio of physician to population ratio in Southeast Asian⁶.

Number and density of cardiac catheterisation labs in Malaysia

In comparison to the previous report in 2014, there was an addition of four hospitals with cardiac catheterisation lab facilities in Malaysia (from 69 to 73) (Table 1.2). Of the total number of hospitals, 15 were public hospitals while 58 were private hospitals; and the total number of cardiac catheterisation labs was 87 (Table 1.2 and Table 1.3). This translates into 2.7 cardiac catheterisation labs pmp in Malaysia in 2015. Pulau Pinang had the highest density (8.2 pmp) while Sabah and WP Labuan had the lowest (0.7 pmp). Generally across the nation, there were more cardiac catheterisation labs in the private sector compared to the government except in Kelantan and Terengganu.

Number of CCU beds in government hospitals in Malaysia

There was a total of 274 allocated CCU beds in all the government hospitals in 2015; 225 beds in MOH hospitals and the remaining 49 beds in MOHE hospitals (Table 1.4). As expected, the number of CCU beds was highest in Selangor, WP Putrajaya and WP Kuala Lumpur. By region, the northern part of the country (Penang, Kedah and Perlis) had 32 CCU beds for 4.05 million population, the central region (Perak, Selangor, WP Putrajaya, WP Kuala Lumpur and Negeri Sembilan) had 131 CCU beds for 11.6 million population, the southern region (Johor and Melaka) had 38 CCU beds for 4.5 million population, the East Coast (Kelantan, Terengganu and Pahang) had 44 CCU beds for 4.53 million population, Sabah and WP Labuan had 14 CCU beds for 3.82 million population, and Sarawak had 15 CCU beds for 2.7 million population. Although most of the cardiac patients were cared for in the CCU, many were treated in high dependency units or the general medical wards as there was a limited number of CCU beds available.

CHAPTER 2: PATIENT CHARACTERISTICS

Alan Fong Yean Yip¹, Paras Doshi², Ong Tiong Kiam¹
1 Pusat Jantung Hospital Umum Sarawak, 2 Hospital Kuala Lumpur

Summary

The baseline characteristics of patients in this report were generally similar to that of the previous report. There are two notable points from this report:

1. Patients who presented with ACS remained young, with a significant proportion under the age of 50 years. Of the three major ethnic groups, over a quarter of Malay and Indian patients presenting with ACS were below the age of 50 years.
2. There was a high prevalence of hypertension, dyslipidaemia and diabetes in this report, comparable with previous reports of the NCVD-ACS Registry.

Introduction

Baseline characteristics from 17,771 patients admitted with acute coronary syndrome (ACS) between 2014 and 2015 were obtained from 23 source data providers (SDP). Comparisons were made with data published from the previous NCVD-ACS annual report¹.

Of all the patients admitted with ACS in 2014 – 2015, 46.1% were ST-elevation myocardial infarction (STEMI), 25.2% were non-STEMI (NSTEMI) and 28.7% were unstable angina (UA). Compared to the previous report, there was a small decrease in the proportion of patients presenting with STEMI (50.8% in the previous report), while there was an increase in the proportion of patients with UA (29.4% in the previous report). The proportion of patients presenting with NSTEMI was similar (26.0% in the previous report).

In the previous report, patients presenting with ACS were primarily young and male (mean age of 58.5 years, 24.2% under the age of 50 years, and 78.8% were male).

Age and gender

The mean (SD) age at admission was 58.6 (12.2) years, with 23.8% of patients under the age of 50 years and 79.3% of the male gender. Among the males, 27.1% were under the age of 50 years; among the female patients, 11.8% were under the age of 50 years.

In the STEMI subgroup of 8,274 patients, the mean (SD) age at presentation was 56.0 (12.0) years, 86.9% were male, and 30.7% were under the age of 50 years. In the NSTEMI subgroup of 4,614 patients, the mean age (SD) at presentation was 61.1 (12.1) years, 75.7% were male, and 17.6% were under the age of 50 years. In the UA subgroup of 5,365 patients, the mean (SD) age of patients at presentation was 60.2 (12.1) years, 69.3% were male, and 19.4% were under the age of 50 years.

Compared to the previous report, the mean age at presentation for ACS and its subgroups, the gender distribution and proportion of young patients (under the age of 50 years), were similar. Malaysians tend to have ACS at a younger age compared to patients from the well-established GRACE registry and Euro Heart Survey^{1,2}.

In the even younger age group (those under the age of 40 years who presented with ACS), there was a small increase in the number of patients compared to the previous report (7.1% versus 6.1%).

Cardiovascular risk factors

Between 2014 and 2015, 95.0% of patients presenting with ACS had at least one of the common cardiovascular risk factors (CVRF), with 20.2% having one, 28.6% having two, 26.9% having three, and 19.4% having four or more risk factors. Of these CVRF, 46.2% had diabetes, 64.7% had hypertension, 38.6% had dyslipidaemia, 36.9% were current smokers, 13.2% had a positive family history of premature coronary artery disease, 16.5%

had a previous history of myocardial infarction, 25.4% had a previously documented coronary artery disease (> 50% stenosis), 9.2% had a history of chronic stable angina, 62.1% had new onset angina (within 2 weeks to index presentation with ACS), 5.8% had a known history of heart failure, 3.9% had chronic lung disease, 8.3% had a history of renal disease, 4.3% a history of cerebrovascular disease and 0.6% a history of peripheral vascular disease.

Compared to the previous report, the profile of patients presenting with ACS were similar, except that there were more patients with a previous documented history of coronary artery disease and more patients with new onset angina. However, there were now proportionately fewer patients who were current smokers, had previous history of myocardial infarction and had a known history of heart failure.

Ethnic differences

The NCVD Registries provide insight into the baseline characteristics of the different ethnic groups presenting with ACS, and the subsequent management and outcome. The three major ethnic groups (Malay, Chinese and Indian) form the majority of the Malaysian population who present to the SDPs that contribute information into this ACS report.

Between 2014 and 2015, the Malays formed 49.2%, Chinese formed 20.6% and Indians 18.4% of the patients who presented with ACS. In the STEMI subgroup, the proportion was 54.6% Malay, 16.4% Chinese and 15.7% Indian. In the NSTEMI subgroup, the proportion was 45.0% Malay, 23% Chinese and 20.5% Indian. In the UA subgroup, the proportion was 44.4% Malay, 25.0% Chinese and 21.0% Indian. These proportions in the different ACS subgroups were similar to that of the previous report and consistent in that the Malays were more likely to present with STEMI.

For Malay males who presented with ACS between 2014 and 2015, 27.2% were under the age of 50, compared to 14.4% of Malay females. For Chinese males who presented with ACS between 2014 and 2015, 17.0% were under the age of 50, compared to 4.1% of Chinese females. For Indian males who presented with ACS between 2014 and 2015, 28.0% were under the age of 50, compared to 13.8% of Indian females.

Within each major ethnic group, the proportions of young patients from each gender presenting with ACS were similar to that of the previous report. Therefore, while the Malays formed the majority of patients presenting with ACS, the proportion of those who were under the age of 50 at presentation were similar to the Indians and both substantially higher than the Chinese patients. This could be due to a variety of factors, for example, the location of the SDPs, which were mainly in urban areas where a larger proportion of the local population were Malays.

Summary

1. The spectrum of ACS in 2014 – 2015 revealed that the commonest subtype was STEMI (46.1%), similar to previous years. However, unstable angina at 28.7% had overtaken NSTEMI. Two-thirds of STEMI had intermediate-high TIMI risk score; whereas NSTEMI-UA had a slightly higher intermediate-high score in 2014 – 2015 compared to 2011 – 2013.
2. The proportion of STEMI remained highest in young patients. The proportion of NSTEMI-UA amongst the elderly ACS cases increased to 62.9%. The proportion of Killip III–IV in the elderly patients had doubled compared to the younger patients.
3. Gender ratio of male:female remained at 4:1 for ACS. 50.5% of men presented with STEMI whereas 70.8% of women presented with NSTEMI/UA.
4. About 43% of ACS patients were diabetic and 60.8% were hypertensive. Among STEMI patients, 38.0% were diabetic and 36.1% were hypertensive. These cohorts of patients have higher Killip III & IV at presentation. The median total cholesterol and LDL-cholesterol were higher in STEMI compared to NSTEMI/UA.

This chapter presents the results of clinical presentation and investigations of patients who were notified and registered in the NCVD-ACS registry in year 2014 – 2015. The outlines of the discussion are:

- 1) Epidemiology
- 2) Clinical presentation
- 3) Diagnosis
- 4) Risk factors: diabetes, dyslipidaemia, hypertension

Epidemiology & clinical presentation

A total of 17,771 ACS were analysed in 2014 – 2015 from our NCVD-ACS registry; of which 8,190 were STEMI (46.1 %), 4,479 NSTEMI (25.2 %) and 5,102 unstable anginas (UA) (28.7 %). Similar to the previous cohorts, STEMI remained the commonest ACS subtype (46.1%). Compared to the previous cohort, mean heart rate, mean SBP and mean DBP were similar. Patients with NSTEMI/UA were older and had higher CV risk factors compared to STEMI patients.

Across the spectrum of ACS, the majority of STEMI patients had angina symptoms within 24 hours compared to NSTEMI/UA (Table 3.1). This observation highlights the importance of public education, to recognise early warning symptoms and to seek early medical attention. Amongst STEMI patients, 67.4% of patients have intermediate-high TIMI risk score, similar to the 2011 – 2013 cohorts (70.3%). Amongst NSTEMI-UA, 48.4% had intermediate-high score in 2014 – 2015, compared to 41.5% in 2011 – 2013. There seem to be an increasing trend of ACS patients who presented with cardiogenic shock compared to the previous cohort (STEMI; 14.7% vs. 13.4%; NSTEMI/UA, 8.3% vs 6.7%).

About 70% of STEMI patients had an echocardiogram examination during the index admission compared to 50% in NSTEMI and 30% in UA. With regards to ECG patterns in patients with STEMI, 52.3% were anterior. 22.2% had lateral involvement, and 7.5% and 7.1% had posterior and right ventricular (RV) involvement respectively.

The proportion of STEMI was highest in young patients, and decreased with advancing age (63.8% in young aged group [20-<40 years old], 52% in middle aged group [40-<60 years old], 37.1% in elderly aged group [\geq 60 years old]), similar to previous years. For NSTEMI/UA, the proportion of elderly patients was higher than the previous cohort (62.9% vs. 57.8%). Killip III–IV was higher in the older sub-group (9.3% in 20 – < 40 years, 13.9% in 40 – < 60 years, and 18.2% in \geq 60 years).

The gender ratio of male:female remained at 4:1 for ACS. STEMI comprised 50% of ACS in men. In contrast, NSTEMI-UA occurred more in women (70.8%). Elderly or female patients tend to have higher systolic blood pressure on presentation.

Pre-morbid risk factors

Diabetes mellitus

About 43% of the patients were diabetic. The highest incidence were seen in STEMI (38.0%) followed by unstable angina (32.9%) and NSTEMI (29.1%). ACS patients with diabetes mellitus had higher SBP (median 139 mmHg vs. 135 mmHg), wider pulse pressure (median 57 mmHg vs. 52 mmHg), higher heart rate (median 83/min vs. 79/min), higher HbA1c (median 8.2% vs. 5.8%), and higher Killip class III & IV at presentation (17.8% vs. 13.3%). Non-diabetic patients had higher LDL (median 3.3 mmol/L vs. 2.8 mmol/L) (Table 3.4).

Hypertension

60.8% of ACS patients were hypertensive. More patients with STEMI had hypertension followed by unstable angina and NSTEMI (36.1%, 35.0% and 28.9% respectively). Hypertensive patients had wider pulse pressure (median 58 mmHg vs. 49 mmHg), higher heart rate at presentation (median 82/min vs 80/min), higher Killip class III and IV (15.7% vs. 14.9%) and higher HbA1c (median 6.9% vs 6.3%) (Table 3.5).

Dyslipidaemia

Medical history of dyslipidaemia was higher in unstable angina (41.7%) compared to NSTEMI (29.6%) and STEMI (28.8%). The median total cholesterol was higher in STEMI followed by NSTEMI and unstable angina; 5.3 mmol/L, 4.9 mmol/L, and 4.5 mmol/L respectively. The same trend was seen for LDL-cholesterol (3.4 mmol/L, 3.0 mmol/L and 2.7 mmol/L respectively). Patients with dyslipidaemia had higher SBP (median 139 mmHg vs. 135 mmHg), wider pulse pressure (median 57 mmHg vs. 53 mmHg) and higher HbA1c (median 6.8% vs. 6.6%) than those without dyslipidaemia (Table 3.6).

Discussion

The commonest ACS presentation was STEMI (46.1%). The guiding principle that “time is muscle” in emergency cardiology implies that every patient with STEMI should be taken up for thrombolysis or primary PCI at the earliest after the onset of symptoms. As diabetes, hypertension and dyslipidaemia are strongly associated with ACS, primary prevention program should be reinforced.

Young is defined as age 20 to less than 60 years, middle-aged is defined as age 40 to less than 60 years, and elderly is defined as 60 years and above

* Definition was different in CRF version 2013

** Symptom to treatment is the time difference between onset of ACS symptom and when patient was given fibrinolytic therapy

Note: Percentage is to the nearest decimal point

* Definition was different in CRF version 2013

** Symptom to treatment is the time difference between onset of ACS symptom and when patient was given fibrinolytic therapy

Note: Not all participating centres performed Troponin T or Troponin I tests

Note: Percentage is to the nearest decimal point

CHAPTER 4: TREATMENT

Jayakhanthan Kolanthaivelu¹, Ng Yau Piow¹, Mohd Rahal Yusoff², Rosli Mohd Ali¹

¹ Institut Jantung Negara, 2 Columbia Asia Klang

Summary

1. Similar lengths of admission was observed in CCU/ICU for all spectrums of ACS and age groups.
2. The use of DAPT was up to 96% for STEMI and more than 90% for NSTEMI. Use of statin was more than 90% for all spectrum of ACS.
3. Use of beta blocker upon discharge was 69% for STEMI, 67.2% for NSTEMI and 66.9% for UA.
4. Use of ACE inhibitor/ARB upon discharge were 56.1%, 50.5%, and 54.5% for STEMI, NSTEMI and UA respectively.
5. 81% of STEMI patients who presented to non-PCI capable centres received fibrinolysis.
6. 16.4% of STEMI patients presenting to PCI-capable centres underwent primary PCI, a significant increase compared to previous report.
7. The median door-to-needle (DTN) time was 45 minutes; and 35.2% achieved DTN time of less than 30 minutes.
8. The median door-to-device (balloon) (DTB) time was 69 minutes; and 63.6% achieved DTB time of less than 90 minutes.

Pattern of admission

The total number of days of admission was almost similar in all the ACS spectrum. Compared to the previous cohort, total numbers of days of admission for STEMI and NSTEMI were 5 days each, and 4 days for UA. The number of days in critical care (ICU/CCU/CICU) was in the range of 2 – 3 days, which was shorter compared to the 2011 – 2013 period.

There was no significant gender difference in the number of days spent in hospital or in critical care units. When compared by age, no significant difference in the length of stay in hospital or critical care units was noted. There was no difference in the number of days spent in hospital or critical care units among all three ethnic groups (Malay, Chinese and Indians).

Pharmacological therapy

Dual anti-platelet (DAPT) use was commendable. More than 96% of the STEMI cohort used aspirin and ADP antagonist upon discharge. For NSTEMI, 93.2% was on aspirin and 91.9% was discharged with an ADP antagonist. The use of aspirin was over 91.6% in the UA cohort; however the use of ADP antagonist in this cohort was only 86.4%. A lower proportion of females were on an ADP antagonist. There was no difference in the use of DAPT between the different age groups and ethnic groups.

Anti-coagulant use was also encouraging during the index hospital admission. Use of anti-coagulant (unfractionated heparin, LMWH, fondaparinux or OAC) was over 90%. There were no differences in terms of ethnicity, age or gender.

Use of lipid lowering agents upon discharge reached 90 – 94% for the HMG CoA reductase group. There were no significant differences between the different age strata, gender or ethnic groups.

The use of beta blockers upon discharge was 69.8% for STEMI, 67.2% for NSTEMI and 66.9% for UA. For patients with STEMI, beta blocker use upon discharge was lower in the elderly (66.1%) compared to the other age strata (75.2% in the young and 71% in the middle-aged). Its use among Malay, Chinese and Indian ethnic groups were similar (68.4%, 68.7% and 69.6% respectively). For the “other ethnic origin”, beta blocker use upon discharge was as high as 76.4%. For patients with NSTEMI/UA, a lower percentage of females were discharged with a beta blocker compared to STEMI (63.5% vs 68.4%). There was no significant difference in its use among the different age and ethnic strata.

As for ACE inhibitors, 56.1%, 50.5% and 54.5% of patients with STEMI, NSTEMI, and UA respectively received these drugs upon discharge. There was a higher use of ARB for the NSTEMI and UA cohorts compared to STEMI (8.1% vs 12.2% vs 3.0% respectively). For STEMI, there was a lower use of ACE inhibitor in the elderly age group (52.5%) and in the female gender (52.9% vs 56.5% in males); however the use of ARB was highest in the elderly age group (4%) and higher in women (4.1% vs 2.8% in males). There was no significant difference in the use of ACE inhibitor upon discharge amongst the different ethnic groups. For NSTEMI/UA, the use of ARB in the middle and elderly age group was higher compared to the young patients (9.6% vs 11.3% vs 4.3% respectively). There was also an increase in the use of ARB upon discharge in women (11.7% vs 9.8%).

Use of diuretics during hospitalisation was also higher in NSTEMI (37.2%) and UA (28.2%) compared to STEMI (22.8%), indicating that patients with NSTEMI presented with a more decompensated heart failure. The use was also higher in the elderly group.

Use of oral hypoglycaemic agent upon discharge was notably higher in NSTEMI and UA (28.9% and 37.3% respectively) compared to STEMI (24.3%). There was a higher use of these agents among females, in the middle-aged and elderly age strata and in the Indian ethnic group.

Insulin use during hospitalisation was higher in the NSTEMI cohort (28.3%) followed by STEMI (26.2%) and UA (22.4%). The use of insulin was highest in the Indian ethnic group, middle and elderly age strata and in females. Upon discharge, insulin was prescribed in 20.1% of patients in the NSTEMI cohort, 18.3% in the UA cohort and 14.4% in the STEMI cohort. In the STEMI cohort, insulin was used more in the middle-aged and elderly groups, women, and the Indian ethnic group. This trend was also seen in the NSTEMI/UA cohort.

Revascularisation

There were 8190 cases of STEMI reported during the period of 2014 – 2015. In general, 69.2% of them received fibrinolytic therapy and 13.7% proceeded directly to primary PCI, which saw an increase of 4.3% compared to the previous cohort. A significant number of patients (13.4%) missed fibrinolytic therapy. Another 3.4% of STEMI patients did not receive fibrinolytic therapy because of contraindications. For those who received fibrinolytic therapy, the median symptom onset to needle time was similar (210 minutes) to the previous period. Women tend to have a longer delay (265 minutes) compared to males (202.5 minutes). Diabetic (225 minutes) and hypertensive (225 minutes) patients also tend to have longer delays compared to patients without diabetes (200 minutes) or hypertension (195 minutes). The elderly also had a longer delay compared to other age group strata. (220 minutes vs 200 minutes)

For STEMI, 81% of patients presented to a non-PCI-capable centre received fibrinolytic therapy as their reperfusion strategy. 18.1 % did not receive any form of reperfusion; 13.8% of which was due to missed MI, 4.2% had a contra-indication for thrombolysis, and 0.1% refused any form of reperfusion therapy. A very small percentage was transferred to a PCI-capable centre for primary angioplasty as their reperfusion strategy (0.1%).

For the majority of patients, the median of symptom onset to needle time still exceeded the 180-minute timeframe. The longest delay in presentation was seen in females (260 minutes), followed by diabetic and hypertensive patients (225 minutes respectively), and the elderly group (220 minutes).

For STEMI patients who presented to a PCI-capable centre, 39% had fibrinolytic therapy as their primary reperfusion strategy, with only 16.4% who underwent primary PCI. About twenty-eight

percent (27.8%) had fibrinolytic therapy at a different centre and was transferred to a PCI-capable centre either due to hemodynamic instability, for rescue PCI, or as part of the pharmaco-invasive strategy. Almost 17% (16.8%) did not receive any form of reperfusion strategy; 13.3% of which was due to missed MI, 3.2% had contra-indication for thrombolysis and 0.3% refused any form of reperfusion therapy. During index hospitalisation, 49.7% underwent in-patient PCI and 1.1% had CABG for STEMI.

The median door-to-needle (DTN) time was 45 minutes; and 35.2% achieved DTN time of less than 30 minutes. Although the median DTN time had remained the same, there were fewer patients achieving a DTN time of less than 30 minutes (35.2%) compared to the previous report (39.2%). Efforts are already underway among the emergency physicians to address this issue to improve the overall DTN time.

The median door-to-device (balloon) (DTB) time was 69 minutes, and 63.6% achieved DTB time of less than 90 minutes. There was great improvement in patients' achieving median DTB time of less than 90 minutes compared to the previous report (63.6% vs 45.3%).

24.6% of NSTEMI and 11.4% of UA had PCI during the index hospitalisation. 1.9% of NSTEMI had CABG during the index hospitalisation.

A higher proportion of middle-aged patients underwent PCI compared to the young and elderly patients (18.2% vs 13.4% vs 13.7% respectively). The proportion of patients in the young age strata receiving PCI during index hospitalisation (13.4%) had dropped from the 2011 – 2013 period (21.8%). Females also had a lower proportion of PCI compared to males (12.9% vs 16.6%). “Other ethnic group” patients (24.6%) had the highest proportion of PCI during the index hospitalisation followed by the Indians (15.7%), Chinese (14.7%) and Malays (14.2%).

Total admission days is derived from Outcome date-Admission date + 1

^ Acceptable range between the previous report (2009 & 2010) and this current version (2011 – 2013) was different

* For CRF version 2013, details of the breakdown are available for ticlopidine, clopidogrel, prasugrel and ticagrelor. These drugs are grouped as ADP antagonist in this current version (2011 – 2013)

Total admission days is derived from Outcome date-Admission date + 1

^ Acceptable range between the previous report (2009 & 2010) and this current version (2011 – 2013) was different

* For CRF version 2013, details of the breakdown are available for ticlopidine, clopidogrel, prasugrel and ticagrelor. These drugs are grouped as ADP antagonist in this current version (2011 – 2013)

** Young is defined as age 20 to less than 40 years, middle-aged is defined as age 40 to less than 60 years and elderly is defined as 60 years and above

Total admission days is derived from Outcome date-Admission date + I

^ Acceptable range between the previous report (2009 & 2010) and this current version (2011 – 2013) was different

*For CRF version 2013, details of the breakdown are available for ticlopidine, clopidogrel, prasugrel and ticagrelor. These drugs are grouped as ADP antagonist in this current version (2011 – 2013)

Total admission days is derived from Outcome date-Admission date + 1

^ Acceptable range between the previous report (2009 & 2010) and this current version (2011 – 2013) was different

* For CRF version 2013, details of the breakdown are available for ticlopidine, clopidogrel, prasugrel and ticagrelor. These drugs are grouped as ADP antagonist in this current version (2011 – 2013)

"Others" includes Orang Asli, Kadazan, Melanau, Marut, Bajau, Bidayuh, Iban, other Malaysian and Foreigner

Table 4.5 Door-to-needle and balloon time distribution for patients with STEMI by year, NCVD-ACS Registry, 2014 – 2015

ACS stratum	STEMI only			
Year	2011 – 2013	2014	2015	2014 – 2015

[#] Total admission days is derived from Outcome date-Admission date + 1[^] Acceptable range between the previous report (2009 & 2010) and this current version (2011 – 2013) was different^{*} For CRF version 2013, details of the breakdown are available for ticlopidine, clopidogrel, prasugrel and ticagrelor. These drugs are grouped as ADP antagonist in this current version (2011 – 2013)^{**} Young is defined as age 20 to less than 40 years, middle-aged is defined as age 40 to less than 60 years and elderly is defined as 60 years and above

Total admission days is derived from Outcome date-Admission date + 1

^ Acceptable range between the previous report (2009 & 2010) and this current version (2011 – 2013) was different

* For CRF version 2013, details of the breakdown are available for ticlopidine, clopidogrel, prasugrel and ticagrelor. These drugs are grouped as ADP antagonist in this current version (2011 – 2013)

CHAPTER 5: OUTCOME

Muhammad Dzafir Ismail¹, Mohd Rahal Yusoff², Ahmad Syadi Mahmood Zuhdi¹, Mohd Firdaus Abdul Hadi¹, Wan Azman Wan Ahmad¹

¹ Pusat Perubatan Universiti Malaya, ² Columbia Asia Klang

Summary

1. The overall in-hospital and 30-day mortality rates remained constant at 7.4% and 9.2% respectively comparable to the last NCVD-ACS 2011 – 2013 report (7.6% and 9%).
2. STEMI remained the highest in-hospital (10.6%) and 30-day (12.3%) risk of mortality after an event. However, at 1-year post ACS, the risk of mortality for NSTEMI had doubled to be 23% higher than STEMI (17.9%).
3. Patients who received fibrinolytic therapy or PCI had better outcomes than those who did not. However, the rate had remained the same from the last report.
4. Hospitals with cardiac catheterisation facility registered lower in-hospital and 30-day mortality rates. Worryingly, the mortality rate for hospitals without cardiac catheterisation facility had worsened.
5. Advanced age, higher Killip classification, and TIMI risk score at presentation as well as diabetes were independent risk factors for poor prognosis.

Overall in-hospital and 30-day mortality

In the year 2014 and 2015, the all-cause in-hospital mortality rates were 7.5% and 7.2% respectively while the 30-day mortality rates were 9.4% and 9.0% respectively (Table 5.1). There was no obvious change in the trend of mortality across all stratum of ACS over these 2 years. In-hospital mortality for STEMI was the highest (10.6%), followed by NSTEMI (8%) and UA (1.6%). The 30-day mortality was also highest in STEMI (12.3%), followed by NSTEMI (10.9%) and UA (2.8%) (Table 5.9).

In contrast to the previous report, patients treated at PCI centres (cardiologist centre) had favourable outcomes for in-hospital and 30-day mortality (6.9% and 8.7%) compared to patients treated at non-PCI centres (physician centre) (10.5% and 12.7%) (Table 5.8). Young patients consistently showed lower rate of mortality for in-hospital and 30-day outcomes (Table 5.2). In terms of ethnic distribution, Indians and those categorised as Others ('Orang Asli' (aboriginal), various East Malaysian tribes, other Malaysian and foreigners) seemed to have better in-hospital and 30-day outcomes. (Table 5.3)

Females had a higher mortality rate compared to males, although there was a slight improvement from the previous report (9.2% for in-hospital and 11.8% for 30-day mortality rates) (Table 5.4).

Patients with traditional cardiovascular risk factors namely diabetes mellitus and hypertension expectedly had higher rate of mortality, which was also seen in the previous report (Tables 5.5, 5.6). Patients with dyslipidaemia had a lower mortality rate, but this could be due to these patients already being on some form of statin. On the other hand, non-dyslipidaemic patients could have been undiagnosed at presentation, hence having a higher mortality rate (Table 5.7).

Outcome at 1-year post ACS

In this latest NCVD-ACS Registry 2014 – 2015, we have included the mortality rates at 1-year post ACS. The overall rate of mortality at 1-year was 17.1%. Comparison with the earlier report was not possible because this data was not captured previously. The mortality rates at 1-year for NSTEMI and UA had increased significantly to 23% and 10.6% respectively compared to the 30-day outcome. The rate of mortality for STEMI was 17.9% at 1-year.

Elderly patients had the highest mortality rate at 24.9% compared to only 6.4% in the younger group. Patients treated at PCI centres (cardiologist centre) had more favourable mortality outcomes (16.5%) compared to those treated at non-PCI centres (physician centre) (21.4%) (Table 5.8). STEMI patients who received fibrinolytic therapy (16%) seemed to have better outcome compared to those who did not (19.3%). An even higher benefit was seen in STEMI patients who had PCI with mortality rate of 13.1% vs those without PCI (21.5%).

Prognostic factors for STEMI patients

Advanced age, higher Killip classification, and TIMI risk score at presentation as well as diabetes were independent risk factors for mortality in-hospital, at 30-day and at 1-year. On the other hand, Indian and other Malaysian patients who received fibrinolytic therapy, patients who underwent cardiac catheterisation, smokers, patients with positive family history of premature cardiovascular disease were found to have good prognosis (Table 5.12.1, 5.12.2, 5.12.3).

The bizarre phenomenon of the ‘smoker’s paradox’ could be explained as follows:

1. Smokers who present with STEMI were much younger.
2. Young STEMI patients tend to have less complex lesion and often single vessel disease.
3. The lesions in smokers were more ‘thrombotic’ vs ‘atherosclerotic’ in non-smokers.

Patients with positive family history of premature cardiovascular disease would have most likely received more aggressive treatment, hence having better survival.

Prognostic factors for NSTEMI / UA

We observed similar predictors of mortality in NSTEMI/UA in the STEMI cohort (Table 5.11.4, 5.11.5, 5.11.6). Patients with severe LV dysfunction in NSTEMI/UA had a higher hazard ratio (8.35) than the STEMI (3.37) at 1-year after an ACS. Similar ‘protective’ factors were also noted in NSTEMI/UA cohort with the addition of dyslipidaemia. As discussed earlier, dyslipidaemic patients were more likely to be on some form of treatment prior to the event unlike those who were non-dyslipidaemic (perhaps undiagnosed).

APPENDIX A: DATA MANAGEMENT

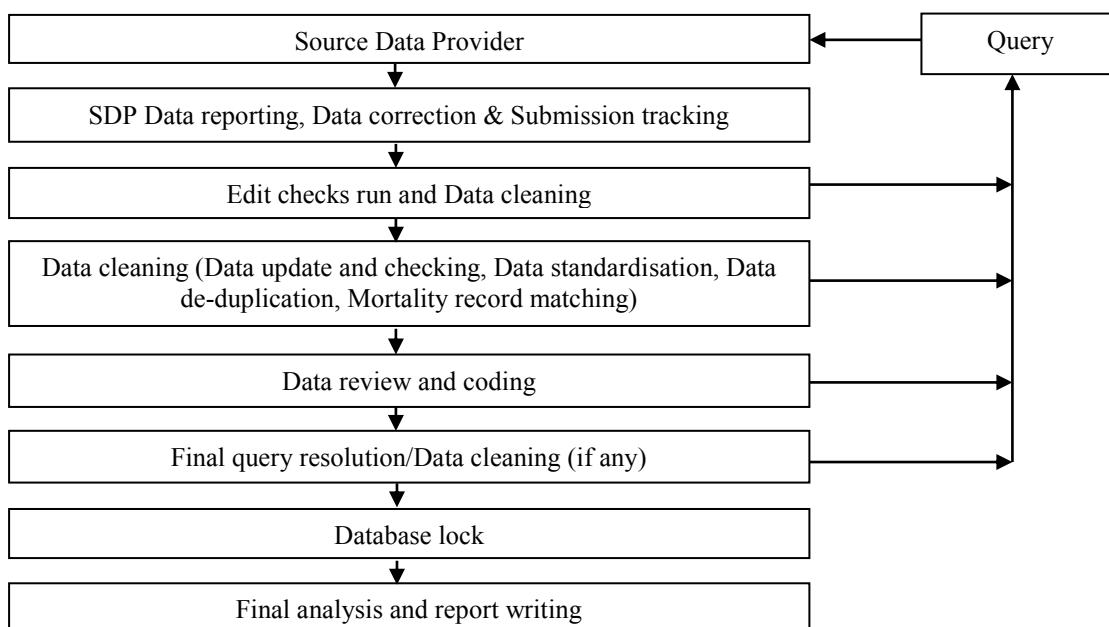

The National Cardiovascular Disease Database (NCVD) Registry maintains two different databases for cardiovascular diseases, i.e. for Acute Coronary Syndrome and Percutaneous Coronary Intervention. Data is stored in SQL Server due to the high volume of data accumulated throughout the years.

Data sources

Source Data Providers (SDPs) of the NCVD-ACS Registry comprise of all major hospitals who have participated in the registry, throughout Malaysia.

Data Flow Process

This section describes the data management flow process of the National Cardiovascular Disease Database Registry.

SDP Data reporting, Data correction and Submission tracking

Data reporting by SDP is done via Web Applications e-Case Report Forms.

There are a number of data security features that are designed into the NCVD web application (eCRF) such as web owner authentication, 2-level user authentication (user name and password authentication and a Short Messaging System (SMS) of authorisation code via mobile phone authentication), access control, data encryption, session management to automatically log off the application, audit trail and data backup and disaster recovery plan.

For ACS, SDP submits NCVD-ACS notification form on an ad-hoc basis whenever a patient is admitted for an ACS event. SDP also submits follow-up data at 30-days and 12-months post notification date intervals. An alert page containing all the overdue submissions for follow-up at 30-days and 12-months post notification date is available to users to ease submissions tracking.

Prior to registering a patient record, a verification process is done by using the search functionality to search if the patient already exists in the registry. The application will still detect a duplicate record if the same MyKad number is keyed in, should the step of searching a patient is not done. This step is

done to avoid duplicate records. For patients whose records already exist in the database, the SDP needs to only add a new ACS notification as the basic patient particulars are pre-filled, based on existing patient information in the database. The ACS and PCI registries share the same patient list.

There are a few in-built functionalities at the data entry page that serve to improve data quality. One such function is auto calculation function to reduce human error, in calculations. There is also an inconsistency check functionality that disables certain fields and prompts the user, if the value entered is out of range.

A real time data query page is also available via the web application to enable users to check which non-compulsory data is missing, out of range or inconsistent. A link is provided on the data query page for user to click on to resolve the query for the particular patient.

Real time reports are also provided in the web application. The aggregated data reports are presented in the form of tables and graphs. The aggregated data reports are typically presented in two forms, one as the centre's own aggregated data report and another as the registry's overall aggregated data report. In this way, the centre can be compared with the overall registry's average.

Data download function is also available in the web application to allow users to download their own centre's data from all the forms entered, for their own further analyses. The data are downloadable as Text - tab delimited (.txt) format, Microsoft excel workbook (.xls) and as Comma separated value (.csv) format.

Edit checks run and data cleaning

Edit checks are performed periodically by the registry manager to identify missing compulsory data, out of range values, inconsistency of data, invalid values and errors with de-duplication. Data cleaning is then performed based on the results of edit checks. Data update and data checking of the dataset is performed when there is a query of certain fields as and when necessary. It could be due to a request by the user, correction of data based on checking via data query in eCRF or after receiving results for preliminary data analysis. During data standardisation, missing data are handled based on derivation from existing data. Data de-duplication is also performed to identify duplicate records in the database that might have been missed out by SDPs. Finally, record matching against the National Death Register (*Jabatan Pendaftaran Negara*) is performed to verify the mortality status of the patient.

Final query resolution / data cleaning / database lock

A final edit check run is performed to ensure that the data is clean. All queries will be resolved before the database is locked, to ensure data quality and integrity. The final dataset is subsequently locked and exported to the statistician for analysis.

Data analysis

Please refer to Statistical Analysis Method section for further details.

Data release policy

One of the primary objectives of the registry is to make data available to the cardiovascular healthcare providers, policy makers and researchers. The registry would appreciate if users acknowledge the registry for the use of the data. Any request for data that requires a computer run must be made in writing (by e-mail, fax, or registered mail) accompanied with a Data Release Application Form and signed Data Release Agreement Form. These requests need prior approval by the Advisory Board before data can be released.

Registry ICT Infrastructure and Data centre

The operation of the NCVD is supported by an extensive ICT infrastructure to ensure operational efficiency and effectiveness.

The NCVD subscribes to co-location service with a high availability and highly secured Internet Data Centre at Cyberjaya in order to provide NCVD with quality assured Internet Hosting services and state-of-the-art physical and logical security features without having to invest in costly data centre setup internally. Physical security features implemented includes state-of-the-art security features such as anti-static raised flooring, fire protection with smoke and heat alarm warning system, biometric security access, video camera surveillance system, uninterrupted power supply, environmental control, etc.

Other managed security services include patch management of the servers, antivirus signature monitoring and update, firewall traffic monitoring and intrusion detection, security incidence response, data backup service done on a daily, weekly and monthly basis, data recovery simulation to verify that the backup works, which is done at least once yearly, network security scan and penetration test done on a half-yearly basis, security policy maintenance, maintenance and monitoring of audit trail of user access, etc. Managed system services such as usage and performance report, operating system maintenance and monitoring, bandwidth monitoring and systems health monitoring are also provided.

APPENDIX B: STATISTICAL METHODS

The statistical analysis described below was conducted on data collected in the NCVD-ACS Registry from year 2014 to 2015.

The inclusion criteria were:

- all patients who had ACS procedures performed between 2014 and 2015
- all patients who are aged 20 years and above

The exclusion criteria were:

- all patients with unknown or missing ACS stratum
- all patients with the final diagnosis of either stable angina or non-cardiac condition

In general, the unit of analysis was the number of patients with admission due to ACS. A total of 17,380 patients were admitted due to ACS from 2014 to 2015 with 391 patients admitted in both years.

Table 1: Distribution of patients by number of admissions, NCVD-ACS Registry, 2014 – 2015

Year	Number of Admissions			
	1	2	Total	
Number of Patients	2014	8,067	391	8,458
	2015	8,922	391	9,313
	Total	16,989	782	17,771

Statistical methods for most chapters involved descriptive analysis. For categorical and discrete data, we calculated frequency and percentage. For continuous data, the mean, standard deviation (SD), median, minimum and maximum values were calculated. An exception to this was the survival analyses, which were performed to evaluate the prognostic factors for in-hospital, 30-day and 1-year mortality in Chapter 5.

For all variables, percentages were only calculated for categories listed in the CRFs.

Missing data were reported for categorical, discrete and continuous data. No statistical imputation was applied to replace missing data. However, to avoid illogical ranges in continuous data, outliers were set to missing data based on acceptable range, as presented in a table below:

Fields	Acceptable Range
Age	≥ 20 years
Height	130 – 250 cm
Weight	30 – 200 kg
BMI	14 – 50 kg m ⁻²
WHR	0.7 – 3.0
Waist Circumference	70 – 130 cm
Hip Circumference	80 – 200 cm
Fasting Blood Glucose	3.0 – 50.0 mmol/L
Systolic blood pressure	50 – 270 mmHg
Diastolic blood pressure	10 – 170 mmHg
Pulse Pressure	1 – 100 mmHg
Heart rate	20 – 200 beats/min

Fields	Acceptable Range
Number of distinct episodes of angina	≤ 20 (0=no episodes)
Total cholesterol	2.0 – 25.0 mmol/L
HDL-C	0.5 – 5.0 mmol/L
LDL-C	0.5 – 20.0 mmol/L
HbA1c	4.0 – 32.0 %
Triglycerides	0.5 – 15.0 mmol/L
Left ventricular ejection fraction	5.0 – 90.0 %
Total admission	1 – 100 days
Number of days in CCU	1 – 30 days
Number of days in ICU/CICU	1 – 30 days
Pain-to-needle time	15 – 1440 minutes
Door-to-needle time	1 – 1440 minutes
Door-to-balloon time	1 – 1440 minutes

The data was analysed based on the focus of each report chapter as described below.

Patient Characteristics

Patient characteristics were summarised in Chapter 2. Number of patients in each year was determined based on their admission year due to ACS. The results presented the patients' age, gender, ethnicity, coronary risk factors, co-morbidities and other variables in the CRF.

Cardiac Presentation

Chapter 3 includes an analysis of the clinical presentations, baseline investigations, electrocardiography, clinical diagnosis at admission, fibrinolytic therapy and invasive therapeutic procedures. An analysis of STEMI time-to-treatment was performed in which we excluded any illogical values of time-to-treatment (such as negative values for pain-to-needle time and door-to-balloon time).

Treatment

Summary of treatments is presented in Chapter 4. The summary of treatments includes duration of hospitalisation, admission days in CCU and ICU, types of treatment and pharmacological therapy given during admission.

Clinical Outcomes

The patient outcomes at discharge, 30-day and 1-year follow-up are presented by their ACS stratum, by pre-morbid conditions and types of treatment. In order to evaluate the status of alive or deceased, individual patients were matched against the status provided by the Malaysian National Registration Department (NRD). Patients were considered as alive at the time of follow-up if the date of their death was not provided in the NRD dataset. Prognostic factors for in-hospital, 30-day and 1-year mortality were also presented in Chapter 5.

Appendix F :Case Report Form

NATIONAL CARDIOVASCULAR DISEASE DATABASE (ACS REGISTRY) NOTIFICATION FORM

For NCVD Use only:

Centre: _____

ID: _____

Instruction: Complete this form to notify all ACS admissions at your centre to NCVD ACS Registry. Where check boxes are provided, please check () one or more boxes. Where radio buttons are provided, check () only one option.

A. Reporting Centre: _____**B. Date of Admission (dd/mm/yy):**

--	--	--	--

SECTION 1: DEMOGRAPHICS

1. Patient Name: <small>(as per MyKad / Other ID)</small>					2. Hospital RN:																							
3. Identification Card Number:	MyKad: <table border="1" style="display: inline-table; width: 100px; height: 20px;"><tr><td> </td><td> </td><td> </td><td> </td><td> </td><td> </td><td> </td><td> </td><td>-</td><td> </td><td> </td><td> </td><td> </td></tr></table> - <table border="1" style="display: inline-table; width: 100px; height: 20px;"><tr><td> </td><td> </td><td> </td><td> </td><td>-</td><td> </td><td> </td><td> </td><td> </td></tr></table>									-									-					Old IC No.:				
								-																				
				-																								
4. Gender:	<input type="radio"/> Male	<input type="radio"/> Female	5. Nationality:	<input type="radio"/> Malaysian	<input type="radio"/> Non Malaysian																							
6a. Date of birth: (dd/mm/yy)	<table border="1" style="display: inline-table; width: 100px; height: 20px;"><tr><td> </td><td> </td><td> </td><td> </td></tr></table>					(write DOB as 01/01/yy if age is known)	6b. Age on admission:	<table border="1" style="display: inline-table; width: 100px; height: 20px;"><tr><td> </td><td> </td></tr></table>			<input type="checkbox"/> (auto calculate)																	
7. Ethnic Group:	<input type="radio"/> Malay	<input type="radio"/> Punjabi	<input type="radio"/> Melanau	<input type="radio"/> Bidayuh	<input type="radio"/> Foreigner, specify country of origin:																							
	<input type="radio"/> Chinese	<input type="radio"/> Orang Asli	<input type="radio"/> Murut	<input type="radio"/> Iban																								
	<input type="radio"/> Indian	<input type="radio"/> Kadazan Dusun	<input type="radio"/> Bajau	<input type="radio"/> Other Malaysian, specify:																								
8. Contact Number:	(1):			(2):																								

SECTION 2 : STATUS BEFORE EVENT

1. Smoking status:	<input type="radio"/> Never	<input type="radio"/> Former (quit >30 days)	<input type="radio"/> Current (any tobacco use within last 30 days)	<input type="radio"/> Not Available
2. Status of Aspirin use:	<input type="radio"/> Never	<input type="radio"/> Used less than 7 days previously	<input type="radio"/> Used more than or equal to 7 days previously	
3. Medical history:				
a) Dyslipidaemia	<input type="radio"/> Yes	<input type="radio"/> No	<input type="radio"/> Not known	g) Chronic Angina (≥ 2 weeks) <input type="radio"/> Yes <input type="radio"/> No <input type="radio"/> Not known
b) Hypertension	<input type="radio"/> Yes	<input type="radio"/> No	<input type="radio"/> Not known	h) New onset angina (<2 weeks) <input type="radio"/> Yes <input type="radio"/> No <input type="radio"/> Not known
c) Diabetes	<input type="radio"/> Yes	<input type="radio"/> No	<input type="radio"/> Not known	i) History of heart failure <input type="radio"/> Yes <input type="radio"/> No <input type="radio"/> Not known
	<input type="radio"/> OHA	<input type="radio"/> Insulin	<input type="radio"/> Non pharmacology therapy/diet therapy	j) Chronic lung disease <input type="radio"/> Yes <input type="radio"/> No <input type="radio"/> Not known
d) Family history of premature cardiovascular disease <small>(1st degree relative with either MI or stroke; <55 y/o if Male & <65 y/o if Female)</small>	<input type="radio"/> Yes	<input type="radio"/> No	<input type="radio"/> Not known	k) Chronic renal disease <input type="radio"/> Yes <input type="radio"/> No <input type="radio"/> Not known <small>[>200 $\mu\text{mol}/(\text{micromol})$ serum creatinine]</small>
e) Myocardial Infarction History	<input type="radio"/> Yes	<input type="radio"/> No	<input type="radio"/> Not known	l) Cerebrovascular disease <input type="radio"/> Yes <input type="radio"/> No <input type="radio"/> Not known
f) Documented CAD	<input type="radio"/> Yes	<input type="radio"/> No	<input type="radio"/> Not known	m) Peripheral vascular disease <input type="radio"/> Yes <input type="radio"/> No <input type="radio"/> Not known
				n) None of the above <input type="checkbox"/>

SECTION 3 : ONSET

1a. Date of onset of ACS symptoms:	<table border="1" style="display: inline-table; width: 100px; height: 20px;"><tr><td> </td><td> </td><td> </td><td> </td><td> </td></tr></table> (dd/mm/yy)						1b. Time of onset of ACS symptoms: (24 hr format)	<table border="1" style="display: inline-table; width: 100px; height: 20px;"><tr><td> </td><td> </td><td> </td></tr></table> (hh:mm)				<input type="checkbox"/> Not Available
2a. Date patient presented:	<table border="1" style="display: inline-table; width: 100px; height: 20px;"><tr><td> </td><td> </td><td> </td><td> </td><td> </td></tr></table> (dd/mm/yy)						2b. Time patient presented: (24 hr format)	<table border="1" style="display: inline-table; width: 100px; height: 20px;"><tr><td> </td><td> </td><td> </td></tr></table> (hh:mm)				<input type="checkbox"/> Not Available
3. Was patient transferred from another centre?	<input type="radio"/> Yes <input type="radio"/> No											

SECTION 4 : CLINICAL PRESENTATION & EXAMINATION

1. Number of distinct episodes of angina in past 24h:		<input type="checkbox"/> Not Available	2. Heart rate at presentation:	<table border="1" style="display: inline-table; width: 100px; height: 20px;"><tr><td> </td><td> </td><td> </td></tr></table>				beats / min
3. Blood pressure at presentation:	a. Systolic:	mmHg	b. Diastolic:		mmHg			
4. Anthropometric: <small>(if not measured, please tick as 'Not Available')</small>	a. Height:	(cm)	<input type="checkbox"/> Not Available	BMI:	(auto calculate)			
	b. Weight:	(kg)	<input type="checkbox"/> Not Available					
	c. Waist Circumference:	(cm)	<input type="checkbox"/> Not Available			WHR:	(auto calculate)	
	d. Hip Circumference:	(cm)	<input type="checkbox"/> Not Available					
5. Killip classification:	<input type="radio"/> Killip I <small>(no clinical signs of heart failure)</small> <input type="radio"/> Killip II <small>(rales or crackles in the lungs, an S_3, and elevated jugular venous pressure)</small> <input type="radio"/> Killip III <small>(frank acute pulmonary oedema)</small> <input type="radio"/> Killip IV <small>(cardiogenic shock or hypotension [measured as systolic blood pressure <90 mmHg], and evidence of peripheral vasoconstriction [oliguria, cyanosis or sweating])</small> <input type="radio"/> Not Applicable/ Not Available							

a. Patient Name:		b. Reporting Centre:	
c. Identification Card No.:		d. Hospital RN:	

SECTION 5: BASELINE INVESTIGATION (values obtained within 48 hours from admission)

		Absolute Value	Unit	Reference Upper Limit	Check (✓) if not done
1. Peak CK-MB:			Unit/L		<input type="radio"/> Not done
2. Peak CK:			Unit/L		<input type="radio"/> Not done
3. Peak Troponin:	a. TnT: b. TnI:	<input type="radio"/> +ve <input type="radio"/> -ve OR <input type="text"/>	ng/mL or mcg/L		<input type="radio"/> Not done <input type="radio"/> Not done
4. Lipid Profile (Fasting):	a. Total Cholesterol: b. HDL-C: c. LDL-C: d. Triglyceride:		mmol/L		<input type="radio"/> Not done <input type="radio"/> Not done <input type="radio"/> Not done <input type="radio"/> Not done
5. Fasting blood glucose:			mmol/L		<input type="radio"/> Not done
6. HbA1c			mmol/L		<input type="radio"/> Not done
7. Left Ventricular Ejection Fraction:			%		<input type="radio"/> Not done

SECTION 6: ELECTROCARDIOGRAPHY (ECG)

1. ECG abnormalities type: (Check one or more boxes)	<input type="checkbox"/> ST-segment elevation ≥ 1mm (0.1mV) in ≥ 2 contiguous limb leads <input type="checkbox"/> ST-segment elevation ≥ 2mm (0.2mV) in ≥ 2 contiguous frontal leads or chest leads <input type="checkbox"/> ST-segment depression ≥ 0.5mm (0.05mV) in ≥ 2 contiguous leads <input type="checkbox"/> T-wave inversion ≥ 1mm (0.1mV)	<input type="checkbox"/> Bundle branch block (BBB) <input type="checkbox"/> Non-specific <input type="checkbox"/> None <input type="checkbox"/> Not stated/ inadequately described
2. ECG abnormalities location: (Check one or more boxes)	<input type="checkbox"/> Inferior leads: II, III, aVF <input type="checkbox"/> Anterior leads: V1 to V4 <input type="checkbox"/> Lateral leads: I, aVL, V5 to V6 <input type="checkbox"/> True posterior: V1, V2	<input type="checkbox"/> Right ventricle: ST elevation in lead V4R <input type="checkbox"/> None <input type="checkbox"/> Not stated/ inadequately described

SECTION 7: CLINICAL DIAGNOSIS AT ADMISSION

1. Acute Coronary Syndrome stratum:	<input type="radio"/> STEMI	<input type="radio"/> NSTEMI	<input type="radio"/> Unstable Angina (UA)
2a. TIMI Risk Score for NSTEMI/ UA:	<input type="text"/> (auto calculate)	2b. TIMI Risk Score for STEMI:	<input type="text"/> (auto calculate)

SECTION 8: FIBRINOLYTIC THERAPY (Following Section is applicable for STEMI only)

1. Fibrinolytic therapy status:	<input type="radio"/> Given at this centre → (Please proceed to number 2 and 3 below) <input type="radio"/> Given at another centre prior to transfer here <input type="radio"/> Not given—proceeded directly to primary angioplasty <input type="radio"/> Not given—missed thrombolysis <input type="radio"/> Not given—patient refusal <input type="radio"/> Not given—contraindicated
Fill in (2) and (3) only if you check 'Given at this centre' in no. (1) above	2. Fibrinolytic drug used: <input type="radio"/> Streptokinase <input type="radio"/> Others (t-PA, r-PA, TNK t-PA)
	3. Intravenous fibrinolytic therapy: a. Date: <input type="text"/> / <input type="text"/> / <input type="text"/> b. Time: (in 24 hr format) <input type="text"/> : <input type="text"/> (hh:mm)
	4. Door to Needle time: <input type="text"/> (minutes) Auto calculated—(time patient presented to time of fibrinolytic therapy given)

SECTION 9: INVASIVE THERAPEUTIC PROCEDURES

1. Did patient undergo cardiac catheterization on this admission at your centre?	<input type="radio"/> Yes <input type="radio"/> No <input type="radio"/> No-transferred to another centre
2. Did patient undergo Percutaneous Coronary intervention (PCI) on this admission?	<input type="radio"/> Yes <input type="radio"/> No <input type="radio"/> Not applicable a. For STEMI → <input type="radio"/> Urgent → <input type="radio"/> Primary PCI <input type="radio"/> Rescue PCI <input type="radio"/> Facilitated PCI <input type="radio"/> Elective → Routine hospital practice? <input type="radio"/> Yes <input type="radio"/> No b. For NSTEMI/UA → <input type="radio"/> Urgent <input type="radio"/> Elective → Routine hospital practice? <input type="radio"/> Yes <input type="radio"/> No
3. First balloon inflation (for STEMI-Urgent PCI only):	a. Date: <input type="text"/> / <input type="text"/> / <input type="text"/> b. Time: (in 24 hr format) <input type="text"/> : <input type="text"/> (hh:mm)
4. Door to balloon time (for STEMI-Urgent PCI only):	<input type="text"/> (minutes) Auto calculated—(time patient presented to time of first angio balloon inflation)
5. Did patient undergo CABG on this admission?	<input type="radio"/> Yes <input type="radio"/> No <input type="radio"/> Not applicable

a. Patient Name:		b. Reporting Centre:	
c. Identification Card No.:		d. Hospital RN:	

SECTION 10: PHARMACOLOGICAL THERAPY

Group	Given during admission		Given at discharge	
1. ASA	<input type="radio"/> Yes	<input type="radio"/> No	<input type="radio"/> Yes	<input type="radio"/> No
2. Ticlopidine	<input type="radio"/> Yes	<input type="radio"/> No	<input type="radio"/> Yes	<input type="radio"/> No
3. Clopidogrel	<input type="radio"/> Yes	<input type="radio"/> No	<input type="radio"/> Yes	<input type="radio"/> No
4. Prasugrel	<input type="radio"/> Yes	<input type="radio"/> No	<input type="radio"/> Yes	<input type="radio"/> No
5. Ticagrelor	<input type="radio"/> Yes	<input type="radio"/> No	<input type="radio"/> Yes	<input type="radio"/> No
6. Other antiplatelet	<input type="radio"/> Yes	<input type="radio"/> No	<input type="radio"/> Yes	<input type="radio"/> No
7. GP receptor inhibitor	<input type="radio"/> Yes	<input type="radio"/> No		
8. Unfrac heparin	<input type="radio"/> Yes	<input type="radio"/> No		
9. LMWH	<input type="radio"/> Yes	<input type="radio"/> No		
10. Fondaparinux	<input type="radio"/> Yes	<input type="radio"/> No	<input type="radio"/> Yes	<input type="radio"/> No
11. Oral anticoagulant (eg. Warfarin)	<input type="radio"/> Yes	<input type="radio"/> No	<input type="radio"/> Yes	<input type="radio"/> No
12. Beta blocker	<input type="radio"/> Yes	<input type="radio"/> No	<input type="radio"/> Yes	<input type="radio"/> No
13. ACE inhibitor	<input type="radio"/> Yes	<input type="radio"/> No	<input type="radio"/> Yes	<input type="radio"/> No
14. Angiotensin II receptor blocker	<input type="radio"/> Yes	<input type="radio"/> No	<input type="radio"/> Yes	<input type="radio"/> No
15. Statin	<input type="radio"/> Yes	<input type="radio"/> No	<input type="radio"/> Yes	<input type="radio"/> No
16. Other lipid lowering agent	<input type="radio"/> Yes	<input type="radio"/> No	<input type="radio"/> Yes	<input type="radio"/> No
17. Diuretics	<input type="radio"/> Yes	<input type="radio"/> No	<input type="radio"/> Yes	<input type="radio"/> No
18. Calcium antagonist	<input type="radio"/> Yes	<input type="radio"/> No	<input type="radio"/> Yes	<input type="radio"/> No
19. Oral hypoglycaemic agent	<input type="radio"/> Yes	<input type="radio"/> No	<input type="radio"/> Yes	<input type="radio"/> No
20. Insulin	<input type="radio"/> Yes	<input type="radio"/> No	<input type="radio"/> Yes	<input type="radio"/> No
21. Anti-arrhythmic agent	<input type="radio"/> Yes	<input type="radio"/> No	<input type="radio"/> Yes	<input type="radio"/> No

SECTION 11 : IN HOSPITAL OUTCOME

1. Number of overnight stays:	a. CCU (days):	
	b. ICU/CICU (days):	
2. Outcome:	<input type="radio"/> Discharged	a) Date: (dd/mm/yy) <input style="width: 20px; height: 15px" type="text"/> / <input style="width: 20px; height: 15px" type="text"/> / <input style="width: 20px; height: 15px" type="text"/>
	<input type="radio"/> Transferred to another centre	a) Date: (dd/mm/yy) <input style="width: 20px; height: 15px" type="text"/> / <input style="width: 20px; height: 15px" type="text"/> / <input style="width: 20px; height: 15px" type="text"/> b) Name of centre: <input style="width: 300px; height: 20px" type="text"/>
	<input type="radio"/> Died	a) Date: (dd/mm/yy) <input style="width: 20px; height: 15px" type="text"/> / <input style="width: 20px; height: 15px" type="text"/> / <input style="width: 20px; height: 15px" type="text"/> b) Cause of death: <input type="radio"/> Cardiac <input type="radio"/> Non Cardiac
	3. Total number of overnight stays:	
4. Final diagnosis at discharge:	<input type="radio"/> STEMI <input type="radio"/> NSTEMI <input type="radio"/> UA <input type="radio"/> Non Cardiac / Non ACS	
5. Bleeding Complication: (TIMI criteria)	<input type="radio"/> Major (<i>Any intracranial bleed or other bleeding $\geq 5\text{g/dL}$ Hb drop</i>) <input type="radio"/> Minor (<i>Non-CNS bleeding with $3-5\text{g/dL}$ Hb drop</i>) <input type="radio"/> Minimal (<i>Non-CNS bleeding, non-overt bleeding, $< 3\text{g/dL}$ Hb drop</i>) <input type="radio"/> None <input type="radio"/> Not stated / Inadequately described	

**NATIONAL CARDIOVASCULAR DISEASE DATABASE (ACS REGISTRY)
FOLLOW UP FORM**

For NCVD use only:

Centre:

ID

Instruction: This form is to be completed at patient follow-up at specified duration (30 days / 12 months) after admission. Following may be performed by telephone interview or clinic visit.

Where check boxes are provided, please check (✓) one or more boxes. Where radio buttons are provided, check (✓) only one option.

A. Reporting Centre:																																											
B. Patient Name:																																											
C. Identification Card Number:	MyKad: <table border="1" style="display: inline-table; vertical-align: middle;"><tr><td> </td><td> </td></tr></table> - <table border="1" style="display: inline-table; vertical-align: middle;"><tr><td> </td><td> </td><td> </td><td> </td><td> </td><td> </td><td> </td><td> </td></tr></table> - <table border="1" style="display: inline-table; vertical-align: middle;"><tr><td> </td><td> </td><td> </td><td> </td><td> </td><td> </td><td> </td><td> </td></tr></table>																													Old IC: <table border="1" style="display: inline-table; vertical-align: middle;"><tr><td> </td><td> </td></tr></table>													
D. Date of Follow Up:	<table border="1" style="display: inline-table; vertical-align: middle;"><tr><td> </td><td> </td><td> </td><td> </td><td> </td><td> </td></tr></table> (dd/mm/yy)							E. Type of Follow Up:	<input type="radio"/> 30 days	<input type="radio"/> 12 months																																	

SECTION 1: OUTCOME

1. Outcome	<input type="radio"/> Alive																			
	<input type="radio"/> Died	→ a. Date of death: <table border="1" style="display: inline-table; vertical-align: middle;"><tr><td> </td><td> </td><td> </td><td> </td><td> </td><td> </td><td> </td><td> </td></tr></table> (dd/mm/yy)									b. Cause of death: <input type="radio"/> Cardiac <input type="radio"/> Non Cardiac <input type="radio"/> Other, specify: _____									
	<input type="radio"/> Transferred to another centre	→ a. Date : <table border="1" style="display: inline-table; vertical-align: middle;"><tr><td> </td><td> </td><td> </td><td> </td><td> </td><td> </td><td> </td><td> </td></tr></table> (dd/mm/yy)									b. Name of centre: _____

SECTION 2: CLINICAL HISTORY AND EXAMINATION (OPTIONAL)

1. Angina status: (CCS classification)	<input type="radio"/> None <input type="radio"/> CCS I <input type="radio"/> CCS II <input type="radio"/> CCS III <input type="radio"/> CCS IV		
2. Functional capacity: (NYHA classification)	<input type="radio"/> None <input type="radio"/> NYHA I <input type="radio"/> NYHA II <input type="radio"/> NYHA III <input type="radio"/> NYHA IV		
3. Blood Pressure:	a. Systolic: mmHg		
4. Anthropometric:	a. Weight: kg	b. Diastolic:	mmHg
	c. Hip circumference: cm	b. Waist circumference:	cm

SECTION 3: INVESTIGATIONS (OPTIONAL)

1. Lipid Profile:	a. Total Cholesterol:	mmol/L	b. HDL-C:	mmol/L
	c. LDL-C:	mmol/L	d. Triglycerides:	mmol/L
2. Left Ventricular Ejection Fraction:	%	3. HbA1c	mmol/L	

SECTION 4: MEDICATION (OPTIONAL)

Group	Given	Group	Given
1. ASA	<input type="radio"/> Yes <input type="radio"/> No	12. Beta Blocker	<input type="radio"/> Yes <input type="radio"/> No
2. Ticlopidine	<input type="radio"/> Yes <input type="radio"/> No	13. ACE inhibitor	<input type="radio"/> Yes <input type="radio"/> No
3. Clopidogrel	<input type="radio"/> Yes <input type="radio"/> No	14. Angiotensin II receptor blocker	<input type="radio"/> Yes <input type="radio"/> No
4. Prasugrel	<input type="radio"/> Yes <input type="radio"/> No	15. Statin	<input type="radio"/> Yes <input type="radio"/> No
5. Ticagrelor	<input type="radio"/> Yes <input type="radio"/> No	16. Other lipid lowering agent	<input type="radio"/> Yes <input type="radio"/> No
6. Other antiplatelet	<input type="radio"/> Yes <input type="radio"/> No	17. Diuretics	<input type="radio"/> Yes <input type="radio"/> No
7. GP receptor inhibitor	<input type="radio"/> Yes <input type="radio"/> No	18. Calcium antagonists	<input type="radio"/> Yes <input type="radio"/> No
8. Heparin	<input type="radio"/> Yes <input type="radio"/> No	19. Oral Hypoglycaemic Agent	<input type="radio"/> Yes <input type="radio"/> No
9. LMWH	<input type="radio"/> Yes <input type="radio"/> No	20. Insulin	<input type="radio"/> Yes <input type="radio"/> No
10. Fondaparinux	<input type="radio"/> Yes <input type="radio"/> No	21. Anti-arrhythmic agent	<input type="radio"/> Yes <input type="radio"/> No
11. Oral anticoagulant agent (eg. Warfarin)	<input type="radio"/> Yes <input type="radio"/> No		

SECTION 5: REHABILITATION AND COUNSELLING (OPTIONAL)

1. Was patient referred to cardiac rehabilitation?	<input type="radio"/> Yes <input type="radio"/> No <input type="radio"/> Not Applicable
2. Has patient stopped smoking?	<input type="radio"/> Yes <input type="radio"/> No <input type="radio"/> Not Applicable
